

CLAIMS

What is claimed is:

- 1 1. A method comprising:
2 selecting one or more microarchitecture events relating to a microprocessor
3 executing an application process to be monitored by one or more hardware
4 monitors;
5 establishing parameters regarding the monitoring of the microarchitecture events
6 by setting one or more monitor control vectors;
7 processing profile data captured by the one or more hardware monitors regarding
8 the occurrence of the one or more microarchitecture events;
9 identifying a region of interest in the application process for optimization based at
10 least in part on the captured profile data; and
11 optimizing the region of interest in the application process.
- 1 2. The method of claim 1, wherein setting each monitor control vector comprises
2 setting one or more fields of the monitor control vector to control the monitoring
3 of the microarchitecture event.
- 1 3. The method of claim 2, wherein setting the one or more fields of each monitor
2 control vector includes setting a control field to establish the type of
3 microarchitecture event that is monitored by a hardware monitor.
- 1 4. The method of claim 2, wherein setting the one or more fields of each monitor
2 control vector includes setting a trigger field to control when a microarchitecture
3 event is monitored.

1 5. The method of claim 2, wherein setting the one or more fields of each monitor
2 control vector includes storing a pointer in a handler field, the pointer identifying
3 a handler routine to process the captured profile data associated with the
4 occurrence of a microarchitecture event corresponding to the monitor control
5 vector.

1 6. The method of claim 1, further comprising obtaining the captured profile data for
2 each monitored microarchitecture event from a profile buffer.

1 7. The method of claim 6, wherein obtaining the captured profile data for a
2 microarchitecture event from the memory buffer occurs when a memory buffer in
3 the profile buffer that is assigned for the monitored microarchitecture event is
4 fully allocated.

1 8. The method of claim 7, further comprising setting one or more conditions for
2 obtaining captured profile data when the memory buffer in the profile buffer is
3 not fully allocated, and setting one or more conditions for transferring captured
4 profile data from a first level in the profile buffer to a second level in the profile
5 buffer.

1 9. The method of claim 8, further comprising receiving an interrupt or special event
2 handler if the buffer that is assigned for the microarchitecture event is fully
3 allocated or if a condition for obtaining captured profile data when the memory
4 buffer in the profile buffer is not fully allocated is met.

1 14. The medium of claim 12, wherein setting the one or more fields of each monitor
2 control vector includes setting a trigger field to control when a microarchitecture
3 event is monitored.

1 15. The medium of claim 12, wherein setting the one or more fields of each monitor
2 control vector includes storing a pointer in a handler field, the pointer identifying
3 a handler routine to process the captured profile data associated with the
4 occurrence of a microarchitecture event corresponding to the monitor control
5 vector.

1 16. The medium of claim 11, wherein the instructions include instructions that, when
2 executed by a processor, cause the processor to perform operations comprising
3 obtaining the captured profile data for each monitored microarchitecture event
4 from a profile buffer.

1 17. The medium of claim 16, wherein obtaining the captured profile data for a
2 microarchitecture event from the memory buffer occurs when a buffer in the
3 memory buffer that is assigned for the monitored microarchitecture event is fully
4 allocated.

1 18. The medium of claim 17, wherein the instructions include instructions that, when
2 executed by a processor, cause the processor to perform operations comprising
3 setting one or more conditions for obtaining captured profile data when the
4 memory buffer in the profile buffer is not fully allocated, and setting one or more

5 conditions for transferring captured profile data from a first level in the profile
6 buffer to a second level in the profile buffer.

1 19. The medium of claim 18, wherein the sequences of instructions include
2 instructions that, when executed by a processor, cause the processor to perform
3 operations comprising receiving an interrupt or special event handler if the buffer
4 that is assigned for the microarchitecture event is fully allocated or if a condition
5 for obtaining captured profile data when the memory buffer in the profile buffer is
6 not fully allocated is met.

1 20. The medium of claim 11, wherein the microarchitecture event monitored is an
2 instruction cache miss event.

1 21. A hardware assisted dynamic optimizer, comprising:
2 an interface to a microprocessor through which the hardware assisted dynamic
3 optimizer establishes parameters regarding the monitoring of one or more
4 microarchitecture events occurring during the execution of an application
5 by the microprocessor;
6 one or more handler routines, each handler routine including instructions to
7 process profiles of a monitored microarchitecture event that are captured
8 by the microprocessor; and
9 one or more optimizers, each optimizer including instructions for optimizing a
10 section of the application, the section of the application being chosen by
11 the hardware assisted dynamic optimizer at least in part based on the
12 captured profiles of a monitored microarchitecture event.

1 22. The hardware assisted dynamic optimizer of claim 21, wherein each monitor
2 control vector includes a plurality of fields to control the monitoring of the
3 microarchitecture event, the plurality of fields being set by the hardware assisted
4 dynamic optimizer.

1 23. The hardware assisted dynamic optimizer of claim 22, wherein the plurality of
2 fields includes:
3 a control field to establish the type of microarchitecture event that is monitored,
4 a trigger field to control when the microarchitecture event is monitored, and
5 a handler field to store a pointer to the handler routine for the microarchitecture
6 event.

1 24. The hardware assisted dynamic optimizer of claim 21, wherein optimizing a
2 section of the application includes increasing the speed of processing of the
3 section of the application.

1 25. The hardware assisted dynamic optimizer of claim 21, wherein the hardware
2 assisted dynamic optimizer obtains the captured profiles of the one or more
3 microarchitecture events from a profile buffer.

1 26. The hardware assisted dynamic optimizer of claim 25, wherein at least a portion
2 of the profile buffer is architecturally visible to the hardware assisted dynamic
3 optimizer.

1 27. The hardware assisted dynamic optimizer of claim 26, wherein the profile buffer
2 has a first level and a second level, and wherein the hardware assisted dynamic

3 optimizer sets conditions for transferring captured profiles from the first level to
4 the second level.

1 28. The hardware assisted dynamic optimizer of claim 27, wherein the hardware
2 assisted dynamic optimizer sets one or more conditions for obtaining captured
3 profiles from the profile buffer.

1 29. The hardware assisted dynamic optimizer of claim 28, wherein a memory buffer
2 in the second level of the profile buffer is assigned to a microarchitecture event,
3 and wherein the hardware assisted dynamic optimizer accesses the profiles of the
4 microarchitecture event when the memory buffer assigned to the
5 microarchitecture event is fully allocated or when a condition for obtaining
6 captured profiles is met.

1 30. The hardware assisted dynamic optimizer of claim 29, wherein the hardware
2 assisted dynamic optimizer accesses the profiles of a microarchitecture event
3 upon receiving an interrupt or special event handler.
